DETAILED ACTION

Response to Arguments

Applicant's arguments, see pages 7-9, filed on August 4, 2008, with respect to the rejections of claims 1-24 have been fully considered and are persuasive. The rejections of the claims have been withdrawn. Applicants arguments for the allowability of the amended claims is persuasive. Applicant argues that the art of record fails to teach "a photonic crystal slab comprising: a two dimensional periodic lattice of holes, said two dimensional periodic lattice of holes comprising: a first nearest neighbor direction and a second nearest neighbor direction ; a lattice constant; and a defect hole, said photonic crystal slab configured to couple said light from said waveguide along said nearest neighbor direction and configured to confine said light in said defect hole at an operating wavelength, wherein a coupling efficiency of said light along said second nearest neighbor direction is greater than a coupling efficiency along said first nearest neighbor direction" or similar limitations in combination with the other claimed limitations.

Applicant's amendments to the claims remove the necessity of the previous double patenting questions.

Allowable Subject Matter

Claims 1-24 are allowed. The following is an examiner's statement of reasons for allowance. Independent claim 1 is allowed because the prior art of record fails to teach or fairly suggest a two dimensional photonic crystal sensor apparatus comprising: a photonic crystal slab comprising: a two dimensional periodic lattice of holes, said two dimensional periodic lattice of

holes comprising: a first nearest neighbor direction and a second nearest neighbor direction ; a lattice constant; and a defect hole, said photonic crystal slab configured to couple said light from said waveguide along said nearest neighbor direction and configured to confine said light in said defect hole at an operating wavelength, wherein a coupling efficiency of said light along said second nearest neighbor direction is greater than a coupling efficiency along said first nearest neighbor direction; in combination with the other recited limitations in the claim. Claims 2-14 are allowed by virtue of their dependence on claim 1.

Independent claim 15 is allowed because the prior art of record fails to teach or fairly suggest a two dimensional photonic crystal sensor apparatus comprising: a photonic crystal slab comprising: a two dimensional periodic lattice of holes comprising: a plurality of defect holes; and a first nearest neighbor direction and a second nearest neighbor direction; said waveguide optically coupling said light to said plurality of defect holes along said second nearest neighbor direction, wherein a coupling efficiency of said light along said second nearest neighbor direction is greater than a coupling efficiency along said first nearest neighbor direction; in combination with the other recited limitations in the claim. Claims 16-17 are allowed by virtue of their dependence on claim 15.

Independent claim 18 is allowed because the prior art of record fails to teach or fairly suggest a two dimensional photonic crystal sensor apparatus comprising: a photonic crystal slab optically coupled to each of said plurality of waveguides; a two dimensional periodic lattice of holes comprising a first nearest neighbor direction and a second nearest neighbor direction; said photonic crystal slab operable to confine said light at a plurality of operating wavelengths in said plurality of defect holes, wherein a coupling efficiency of said light along said second nearest

neighbor direction is greater than a coupling efficiency along said first nearest neighbor direction; in combination with the other recited limitations in the claim. Claims 19-21 are allowed by virtue of their dependence on claim 18.

Independent claim 22 is allowed because the prior art of record fails to teach or fairly suggest a three dimensional photonic crystal sensor apparatus comprising: said three dimensional photonic crystal lattice structure comprising a defect region; a first nearest neighbor direction and a second nearest neighbor direction; said crystal lattice structure configured to confine said light at an operating wavelength in said defect region, wherein a coupling efficiency of said light along said second nearest neighbor direction is greater than a coupling efficiency along said first nearest neighbor direction; in combination with the other recited limitations in the claim. Claim 23 is allowed by virtue of its dependence on claim 22.

Independent claim 24 is allowed because the prior art of record fails to teach or fairly suggest a photonic crystal sensor apparatus comprising: a first nearest neighbor direction and a second nearest neighbor direction and being optically couple to said waveguide along said second nearest neighbor direction, said photonic crystal structure configured to receive light from said waveguide and configured to confine said light in said lattice defect at an operating wavelength, wherein a coupling efficiency of said light along said second nearest neighbor direction is greater than a coupling efficiency along said first nearest neighbor direction; in combination with the other recited limitations in the claim.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
